Odds = chance of a session closing in the money by that Friday, bootstrapped from the ticker's last 60 sessions (calibrated on 1,940 past recos). Mkt = the market's odds for the same event, implied by the option's own mid price. Piv = weekly pivot (H+L+C)/3 of last week; Hedge = max-pain strike for the 1st-Friday expiry (same math as Hedge Target). Green = Odds beat Mkt by 10+ points (option looks cheap), red = Odds trail Mkt by 10+ (looks expensive). Large differences can also mean the market knows something — check for earnings before expiry. Showing 19 of 90 contracts: a week is listed when its Odds are at least 45% and the contract costs at most $0.14 (1wk) / $0.21 (2wk); otherwise it shows --.

Every row is logged to reco_probs_log.csv (source = oscan); score it with OddsTester.py --log.
